

PROTECT EXPENSIVE EQUIPMENT

Antunes WareWash Systems use a NSF approved drinking water additive which controls mineral scale deposits in plumbing systems and add hot water-fed equipment. Unlike standard treatments, the Antunes additive is specifically formulated to work in high-temperature / high-hardness environments providing take out mineral scale prevention and corrosion control.

Model: Warewash System

Antunes WareWash System protects equipment by:

1. **Reducing the hard mineral scale precipitation** by making minerals more soluble in water.
2. **Stopping mineral scale build up** by changing the shape of any precipitated minerals.
3. **Forming a protective glass-like lining** on wet surfaces providing a deterrent to corrosion and scale.
4. Helping loosen and **remove existing mineral scale deposits** over time.
5. A quick glance at the high-temp translucent housing indicates when cartridges have dissolved and replacement is needed - no electricity, drain lines, maintenance or guess work is required.

WareWash Water Treatment System
